

STILL ONLY ONE EARTH:
Lessons from 50 years of UN sustainable development policy

POLICY BRIEF #37

Pathways to Sustainable Cities

Jennifer Bansard

April 2022

Key Messages and Recommendations

- Most of the world's population lives in urban areas, with the proportion projected to reach 68% in 2050.
- Increasing urbanization contributes to biodiversity loss, increased material consumption, and climate change.
- Ensuring all urban residents have access to basic services such as water and sanitation remains an important preoccupation for urban planning worldwide.
- Urban planning needs to be inclusive and responsive to the needs of local communities and build on participatory approaches that foster the engagement of marginalized actors.
- Achieving sustainable cities requires overcoming barriers between different levels of government, attending to urban-rural linkages, and fostering decarbonization across the energy, transport, and building sectors.

Urban sustainability initiatives regularly make headlines. Paris, France, for example has received much attention for [new bike lanes](#) and a generalized [speed limit of 30 km/h](#) for motorized traffic. Havana, Cuba, is famous for its [urban agriculture](#); Curitiba, Brazil, is a pioneer in [bus rapid transit systems](#); and

Amsterdam, the Netherlands, is referred to as the [world's cycling capital](#).

Yet, often enough, when cities are featured in the news, headlines sound the alarm on the detrimental impacts of unsustainable urban development: Jakarta, Indonesia, [is sinking](#); New Delhi, India, [shut down schools](#) amid

Green roofs, like this one in Singapore, reduce cities' heat island effect, decrease energy costs, improve air and water quality, sequester carbon, and provide habitat for urban wildlife. (Photo: CHUTTERS/NAP/Unsplash)

high levels of air pollution; and residential [buildings are collapsing](#) due to lack of maintenance in Marseille, France. Recent reports highlight key figures, including:

- the proportion of the world's population living in urban areas grew from 30% in 1950 to 55% in 2018 and is projected to reach 68% in 2050, with almost 90% of the projected increase to take place in Asia and Africa (UNDESA, 2019)
- in 2018, 24% of the global urban population lived in slums, often with limited access to basic services and with the proportion being as high as 56% in Sub-Saharan Africa (UNDESA, 2021)
- urban areas have more than doubled between 1992 and 2018, contributing to biodiversity loss (IPBES, 2019)
- cities are powerhouses of economic growth—contributing about 60% of global gross domestic product (GDP),

but also account for a high percentage of global carbon emissions and natural resource use (UN, 2019)

- urbanization has exacerbated the impacts of global warming, with urban centres being warmer than their surrounding areas due to the urban heat island effect (IPCC, 2021)

Although sustainable urban development is receiving increased attention, the topic is not new. In fact, it was on the agenda of the very first multilateral environmental conference, the landmark [1972 United Nations Conference on the Human Environment](#) in Stockholm, Sweden. At the time of the conference, which convened in the context of the decolonization process, urbanization was much lower, though growing. Policymakers nevertheless recognized urban sprawl has destructive impacts on the environment and that, while people move to urban areas with hopes of better employment opportunities and living conditions, cities often struggle to meet the increased demand for housing, mass transit, and other infrastructure. The question of how to ensure sustainable urban development has been on the global agenda ever since.

“Planning must be applied to human settlements and urbanization with a view to avoiding adverse effects on the environment and obtaining maximum social economic and environmental benefits for all. In this respect, projects which are designed for colonialist and racist domination must be abandoned.”

[1972 STOCKHOLM DECLARATION, PRINCIPLE 15](#)

Selected Sustainable Urban Development Milestones

1972	<p>UN Conference on the Human Environment</p> <ul style="list-style-type: none"> • Adopted the Stockholm Declaration, which featured a principle on sustainable urban development • Adopted the Stockholm Action Plan, which recommended the planning and management of human settlements for environmental quality • Recommended convening a thematically dedicated conference on human settlements
1976	<p>First UN Human Settlements Conference (Habitat I)</p> <ul style="list-style-type: none"> • Adopted the Vancouver Declaration and recommendations for national planning • Initiated the creation of the UN's focal point for sustainable urbanization, the United Nations Commission on Human Settlements, an intergovernmental body, and its secretariat, the UN Centre for Human Settlements (commonly referred to as "Habitat")
1987	<p>"Our Common Future," the report of the World Commission on Environment and Development</p> <ul style="list-style-type: none"> • Featured a chapter on "The Urban Challenge," which put into perspective urbanization challenges in the Global South and the Global North
1992	<p>UN Conference on Environment and Development</p> <ul style="list-style-type: none"> • Adopted Agenda 21, a program of action that featured a chapter on promoting sustainable human settlement development
1996	<p>Second UN Human Settlements Conference (Habitat II)</p> <ul style="list-style-type: none"> • Adopted the Habitat Agenda by which governments committed themselves to achieving the goals of adequate housing for all and sustainable human settlements, and which contains a global plan for action to support its implementation
2015	<p>Sustainable Development Goals (SDGs)</p> <ul style="list-style-type: none"> • The UN General Assembly adopted the SDGs that include a dedicated goal for sustainable urban development, SDG 11, which calls for making cities and human settlements inclusive, safe, resilient, and sustainable
2016	<p>UN Conference on Housing and Sustainable Urban Development (Habitat III)</p> <ul style="list-style-type: none"> • Adopted the New Urban Agenda, which sets out a 20-year action agenda

Figure 1. SDG 11: Make cities and human settlements inclusive, safe, resilient and sustainable

Multi-dimensional Issue

As set forth in the Vancouver Declaration adopted at the 1976 UN Human Settlements Conference (Habitat I), the most important objective of urban development policy is the improvement of the quality of life for all people, beginning with satisfying basic needs such as food, shelter, clean water, employment, health, and education. This objective has been reconfirmed throughout the years, including in the 2016 New Urban Agenda.

This underscores a fundamental reality: the starting line is not the same for all. Whereas fulfilling fundamental needs—such as through improving access to clean piped water and sanitation—remains an important part of urban planning in many cities of the Global South, discussions on sustainable cities in the Global North mainly centre on how to make existing infrastructure more efficient and less wasteful. In the latter, the aim is for a “transformation” of building, energy, transport, and other systems toward enhanced environmental sustainability—for example, promoting better building insulation for reduced heat waste or fostering waste recycling. As Youba Sokona, South Centre, and Vice-Chair of the Intergovernmental Panel on Climate Change (IPCC), [recently noted](#), “In Africa the question is less about transformation and more about ‘jump starting’ their development in a sustainable manner.”

Beyond this stark global divide, there are significant differences within individual cities: higher-income neighborhoods are typically better serviced than low-income areas and some communities face discrimination that hampers the fulfillment of their fundamental needs. Life in Banana Island, one of Lagos,

Nigeria’s gated communities, with well-maintained roads and a central sewerage system, is vastly different from that in the nearby Makoko slum, where residents live under the threat of eviction and lack access to basic services (Ajayi et al., 2019). Roma people, Europe’s largest ethnic minority, continue to struggle with precarious housing and the US city of Flint, Michigan, whose African-American inhabitants suffered years of lead-poisoned water before a court confirmed wrongdoing, became the poster child of environmental racism. Today, discussions on ensuring access to basic services for all stand side-by-side with futuristic reflections on urban air mobility and drone-based delivery systems.

Sustainable urban development also spans various sectors, key among them housing, transportation, energy, water, waste, food, and health. But that’s not all. As multilateral declarations adopted over the past fifty years highlight, sustainable urban development also touches on heritage preservation, disaster planning, urban-rural linkages, and much more. Striving for sustainable cities requires a holistic vision for how to accommodate increasingly large urban populations, ensuring sustainable livelihoods, quality of life, and social cohesion, while minimizing cities’ and city dwellers’ immediate and long-term impact on the environment. Consequently, all challenges associated with the very notion of sustainability come to the fore in urban areas.

Finally, sustainable urban development is multi-dimensional because it spans a wide array of urban realities. Cities vary in size, with metropolises such as Manila, Philippines, or Beijing, China, having populations ten times larger than entire countries, such

as Slovenia and Lesotho. These cities, which would rank among the top 60 most populous countries of the world, must deal with sustainable urban development challenges on a different scale than cities of little more than 50,000 inhabitants. And differences do not only relate to cities' sizes, but also to factors such as their historical development and geographic location. Coastal cities must plan for sea level rise, while other cities might face water scarcity or must deal with an industrial downturn. There is no single recipe for sustainable urban development. It materializes differently, depending on cities' specific contexts.

Urban Sustainability is Shaped by Many Actors

Local governments are the key players for fostering of urban sustainability as they can take measures within their own jurisdiction. They are also increasingly engaged in transnational networks, such as [ICLEI](#) – Local Governments for Sustainability and the [C40 Cities](#) Climate Leadership Group. These networks provide space for peer-learning among local governments from different countries and serve to feed urban perspectives directly into regional and global sustainability debates. But fostering sustainable cities is not only a matter for local governments. Other actors have power to steer cities toward sustainability.

For one, while the concrete allocation of authority differs between countries, actors at varying government levels have a role to play. National governments might set up an overall housing strategy with tax incentives for the development of new rental housing

The World Urban Forum provides space for peer-learning among local governments from different countries and serves to feed urban perspectives directly into regional and global sustainability debates. (Photo: Natalia Mroz, IISD/ENB)

or pass legislation on insulation or energy efficiency, while cities can develop specific building codes and measures to support social housing. Others can also influence urban sustainability by adopting specific policies and standards, such as influencing norms or opening funding opportunities. This includes state, provincial, or regional governments in federally structured countries, supranational entities, where relevant, and multilateral fora.

Further, non-governmental actors—including businesses, civil society organizations, schools, research institutions, and faith-based organizations—are also sustainability agents. They can self-govern toward sustainability, such as by adjusting diets in [canteen menus](#) or switching to [renewable energy](#). At a larger scale, they can take outward-facing initiatives, such as hosting a [repair café](#) to help people fix broken household items and [sharing information](#) on grant programs for home retrofits, and pressure governments by [lobbying for cities to phase out fossil fuels](#). Corporate initiatives toward enhanced urban sustainability can help develop new technologies and business models, with many leveraging big data and sharing economy approaches. Actors engage in sustainability

initiatives for various reasons. As Westman et al. (2021) show, small- and medium-sized enterprises notably aim to improve their reputation in the local community, increase efficiency, or align with personal values.

Some initiatives—such as when [exasperated citizens build their own bike lanes](#)—are disruptive and constitute a push for change from the bottom, while at other times windows of opportunity are opened from the top. Change often relies on the interplay between different kinds of actors, both governmental and non-governmental. Fostering urban sustainability nevertheless remains a protracted undertaking. Key challenges include that local governments at times lack the autonomy or fiscal and human capacity to undertake sustainability measures and that powerful actors—such as central governments or large businesses—might stand in the way of change (Beermann et al., 2016).

In recent years, an increasing number bicycle sharing systems emerged in cities across the world, like New York City's Citi Bike. (Photo: Robinson Greig/Unsplash)

Key Trends in Sustainable Urban Development

Many new approaches to sustainable urban development are breaking with the long-predominant mindset of “taming nature” and are bringing back greenery into the infamous concrete jungle. Think of urban agriculture, which is gaining ground in the collective imagery of sustainable cities.

More broadly, there is a strong move toward what is increasingly termed “[nature-based solutions](#).” A look at urban water management provides many examples: New York City is [restoring oyster reefs](#), cities like Seoul are [daylighting water streams](#) buried under concrete for many decades, and China is supporting the development of so-called [sponge cities](#). Rather than relying only on hard engineering, these cities leverage natural infrastructure to achieve multiple benefits, not only enhancing flood management but also providing recreational opportunities and supporting biodiversity, among other benefits. Many such measures are designed to address climate change, especially from an adaptation and resilience standpoint. They can mitigate the urban heat island effect and flooding—both from increased precipitation events and, where relevant, storm surges. Plants are not only used on the ground and on roofs but also on facades, with architects and urban residents increasingly experimenting with vertical gardens. Similarly, urban wastelands and unused industrial infrastructure are being renatured to provide habitat for urban biodiversity and recreational spaces for city dwellers, with New York City's [High Line](#) and Atlanta's [BeltLine](#) in the US as flagship projects.

Cities are also grappling with the detrimental effects of decades of car-centred urban planning, which fostered urban sprawl, placed a barrier on other forms of transportation, contributed to a large share of cities' greenhouse gas emissions, and lead to local air pollution (OECD, 2018). Multimodal transportation initiatives are sprouting up around the world in various forms, including: establishing toll roads (Singapore; London, UK), enabling free public transportation for residents (Aubagne, France; Tallinn, Estonia), installing cable cars (Medellín, Colombia; Constantine, Algeria), and giving priority traffic lights to cyclists as a default or when it rains (Odense, Denmark; Rotterdam, the Netherlands). Additionally, there are corporate initiatives such as bicycle and scooter rentals, and civil society actions, such as the collective bike rides of the Critical Mass movement. Most recently, the COVID-19 pandemic brought about a [reckoning](#) about the immense amount of urban space allocated to cars. In many cities, residents have become fond of newly extended sidewalks and parking spaces converted for outdoor dining. Whether this will truly bring about permanent change remains to be seen.

More fundamentally, equity considerations are increasingly coming to the fore, as people grapple with the fact that urban development has failed to make cities liveable for all. Building on the work of feminist and disability studies scholars, the World Bank (2020) provides a toolkit for redressing the fact that “In general, cities work better for heterosexual, able-bodied, cisgender men than they do for women, girls, sexual and gender minorities, and people with disabilities” (p. 8). Meehan et al. (2020) draw attention to intersecting social

Multimodal transportation initiatives, like the cable cars in Medellín, Colombia, are sprouting up around the world. (Photo: iStock)

and racialized inequalities that curtail access to basic services, even in some of the most affluent cities in the world. This reckoning not only pertains to the detrimental effects of past urban planning, but also relates to more recent developments. For example, [hostile architecture](#) that has flourished in many places with the aim of banishing homeless people is increasingly decried as a manifestation of failures to address the root causes of homelessness and for rendering public spaces unwelcoming to urban dwellers at large. This critical reflection also relates to the potential negative effects of some sustainability measures, where green gentrification can increase local property values and displace existing residents who can no longer afford to live in the neighbourhood (Angelovski, 2016).

Against this background, it is important to pay attention to inclusive urban planning. [Decisions](#) adopted at Habitat I in 1976 already

stipulated that “Public participation is a right that must be accorded to all segments of the population, including the most disadvantaged” (p. 76) and that “Citizens must be provided opportunities for direct involvement in the decisions that profoundly affect their lives” (p. 71). This can foster democratic legitimacy and adapt measures to specific local contexts, which can enhance their effectiveness. Yet, as UN-Habitat (2019) notes, ensuring public participation in practice remains a challenge and “when deliberation occurs it is often biased towards more powerful stakeholders with greater resources” (p. 23). To overcome long-standing challenges with implementing participation ideals, scholars, community organizations, and some local governments are experimenting with different approaches, including participatory budgeting and community mapping exercises (Calisto Friant, 2019; Klopp & Cavoli, 2019).

As more and more people live in urban areas, coupled with worsening impacts from climate change and natural resource loss, the magnitude of the urban sustainability

challenge and the need for decisive action is bigger than ever. As the world saw with the COVID-19 pandemic, overcrowding and poverty make it difficult to follow recommended measures such as social distancing and self-isolation. This calls for a holistic rethinking about how to make cities liveable for all while minimizing adverse impacts on the environment.

Striving for sustainable cities requires overcoming barriers between different levels of government as well as vested interests in preserving the status quo. It requires looking beyond the sphere of the urban to attend to urban-rural linkages, foster circular resource use, and decarbonize the energy, transport, and building sectors. Urban sustainability requires cross-sectoral planning and attention to the differentiated needs of all urban dwellers so as to leave no one behind in the necessary transformation. Sustainability pathways should be tailored to specific urban contexts. As such, there will never be one single model for what a sustainable city looks like.
